No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CCGGAGCCCTGAACAGGAAGGAGTTTCTTGCTCCTCCTCCTGCACACCGCCTGCGCA 300
                                                                                                                                                                                                                                                                                                                 coding for human PRO347 (UN0306) (see AAY06482). The clone was isolated from a foetal kidney library. Amplification of DNA44176 occurs in various tumours, suggesting an association with tumour formation or growth. Antagonists (e.g. antibodies) directed against PRO347 may have use in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAY06477-90) may be useful targets for the diagnosis and/or treatment (including prevention)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                        This is the nucleotide sequence of cDNA clone DNA44176 (ATCC 209532)
                                                                                                                                                                                                                                    Antibody against proteins expressed in neoplastic cells, useful for tumor diagnosis and treatment

       The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses.

```
New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described. The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources.
                                                                                                                                                                                                                                                                                                                                          New human nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO polypeptides, useful as pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            540

The present sequence is human protein with hydrophobic domain encoding cDNA clone HP10760. The polynucleotide and polypeptide of the invention may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The polynucleotides into a host cell and culturing the cell to express the protein. The polynucleotides and its complementary sequences may also be used as DNA probes in diagnostic assays and also used in gene therapy. The polynucleotides and its complementary sequences may also be used as DNA probes in diagnostic assays and also used in gene therapy. The colypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators of polypeptide expression and in assays to identify modulaters of polypeptide expression and call proliferation activity, to modulate cytokine and cell proliferation activity, to modulate tissue growth activity (e.g. for the treatment of microbial infections and autoimmune disorders such as multiple sclerosis, theumatodia arthritis and insulin-dependent diabetes), to modulate tissue growth activity (e.g. for the chaematopoiesis, to modulate tissue growth activity (e.g. for controlling fartility), to modulate activity and inhibin activity (e.g. for controlling fartility), to modulate chemotactic and chemokinetic activity, to modulate receptor controlling activity, to modulate receptor controlling activity, to modulate thrombolytic activity, to modulate receptor controlling activity, to modulate inflammation and to inhibit tumour growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Human T139 nucleic acids and polypeptides, useful for treating proliferative disorders associated with aberrant T139 expression or activity .

Claim 2; Fig 1; 115pp; English.

This cDNA encodes a human T139 polypeptide. The T139 polypeptide can be expressed by standard recombinant methodology. The T139 CDNA insert is deposited with ATCC under accession number 98694. The T139 polypeptides and polynucleotides can be administered therapeutically or activity, especially proliferative or differentiative cypression or activity, especially proliferative or differentiative disorders, e.g. of the immune system. They can be used to modulate spermatogenesis, e.g. as a contraceptive to decrease spermatogenesis or to treat disorders related to defects in sperme egg fusion. They may also be useful to treat testicular disorders e.g. testicular cancer. The polypeptides may be used to identify selectively binding compounds which may be useful for detecting the polypeptides; and identifying compounds modulating polypeptide activity. The polynucleotides are useful for producing probes or primers that selectively hybridize to the polynucleotides which may be useful for detecting the polynucleotides in a sample, gene mapping; identifying cells or tissues expressing aberrant T139 levels; determining if a gene has been mutated or deleted to may level; and for monitor therapeutic interventions; and for producing antisense sequences for therapeutic administration to modulate /prevent T139 expression.

The invention relates to nucleic acids encoding a variety of proteins human T139 (TANGO-139), T125 (TANGO-125), T110 (TANGO-110), murine T175 crumurine WDNM-2, having diagnostic, preventive, (TANGO-175), human T175 or murine WDNM-2, having diagnostic, preventive, therapeutic and other uses. Polypeptide of the invention has the ability to modulate cell-cell interactions, haematopoiesis and the ability to modulate clotting. Polypeptide and polymucleotide of the invention are useful for diagnosing and treating disorder characterised by their aberrant expression or activity. The antibodies are useful as modulating agents in regulating a variety of cellular processes e.g. cell proliferation and/or cell differentiation. TANGO-139 is useful for treating defects such as kidney failure, TANGO-125 is useful in wound healing and for treating cancer, TANGO-110 creating cancer, are useful to treat pancreatic disorders, such as content disease, cardiovascular disease, and tumnours, and injury or traumance heart disease. cardiovascular disease, and tumnours, and injury or treating chomeroulonephritis), TANGO-139, 125, 110, 175 molecules are useful to treat crone chomic pheart disease, cardiovascular disease (e.g., acute and choner disease. TANGO-139, 125, 110 and 175 molecules are useful to treat crone choner disease. TANGO-139, 125, 110 and 175 molecules are useful to treat crone choner disease. TANGO-139, 125, 110 and 175 molecules are useful to treat crone choner disease. Cardiovascular associated diseases and disorder. TANGO-125 treats prostate disorders, such as inflammatory diseases, Crohn's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          wover TANNEU POLYpeptides and nucleic acid molecules useful as modulating agents in regulating cellular processes and for diagnosing and treating heart, liver, lung, kidney, inflammatory and cellular proliferative disorders

disease and tumours. TANGO-139, 125, 110, 175 or WDNM-2 are useful for treating proliferative disorders, inflammatory disorders. TANGO-175, or WDNM-2 activity also include apoptotic disorders, rheumatoid arthritis, systemic lupus erythematosus, insulin-dependent diabetes mellitus, immune-related disorders, e.g., immunodeficiency disorders, viral disorders, cell growth disorders, e.g., cancers and inflammatory disorders and apoptotic disorders. The nucleic acids of the invention are used in gene therapy. The present sequence is human T139 cDNA.

proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and anyolving abnormal anglogenesis, neurodegeneration and/or

Tilly polypeptide can be expressed by standard recombinant methodology.

The Tilly polypeptide and be systemed accession number of the Tilly polypeptides and polynucleotides can be administered therapeutically or prophylactically to treat/prevent disorders associated with aberrant Tilly expression or activity, especially proliferative or disorders, e.g. of the immune system. They can be used to modulate spermatogenesis, e.g. of the immune system. They can be used to contact some to treat disorders related to defects in sperm-egg spermatogenesis or to treat disorders related to defects in sperm-egg tision. They may also be useful to treat testicular disorders e.g. testicular cancer. The polypeptides may be used to identify selectively binding compounds which may be useful for detecting the polypeptides in selectively hybridize to the polynucleotides or primmers that selectively hybridize to the polynucleotides which may be useful for detecting the polynucleotides in a sample, gene mapping; identifying cells or tissues expressing aberrant Tilly levels; determining if a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; T139 polypeptide; immune system disorder; spermatogenesis; ss; sperm-egg fusion; testicular disorder; testicular cancer; gene mapping.

The invention relates to primers for synthesising full length cDNA clones, 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human cDNA of the invention.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

diagnostic coding sequences of the invention.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as for foods supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. Che polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequences. AAS64197-AAS94564 represent novel human

                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polynucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12557 tepresent human ovarian carcinoma polynucleotides and proteins used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                         Immunogenic portion of an ovarian carcinoma protein and the nucleic acid encoding it, useful for the diagnosis, prevention and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         964 TCTGTGACATCGGCTACGGGGGAGCCCAGTGTGCCACAAGGTGCATTTTCCCTTCCACA 1023
